

UPSmart2000R

UPSmart2000R

UPSmart2000R is a monitoring software for dry-contact UPS, which connect to the PC by DB9 port or USB. It could monitor and display the current status of the UPS and utility to make users learn the power supply situation. UPSmart2000R provides automatically alarm and send the e-mail notification when the utility Intermit or the battery capacity is low. It also could provide other functions, ex. automatically keep in files, shut down the system safely.

Features

- Support DB9 and USB connection.
- Auto monitor when turn on UPS (need windows NT environment)
- Auto test the equipment connection.
- Auto check the status of utility and battery timely, display and keep records of UPS working status.
- Auto email for events notification
- Shut down the system and auto do files.
- Turn off PC at the same time to shut down UPS
- Set up the delay time from the abnormal power happening to shutdown the system.

UPSmart 2000I

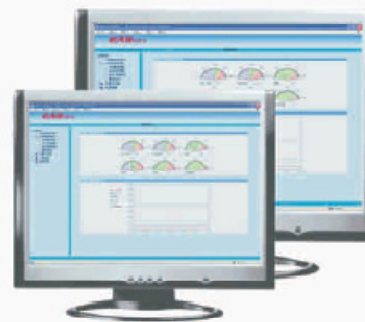

UPSmart 2000I

UPSmart 2000I is a smart UPS monitoring and controlling software applied to RS-232 and USB port. When the Mains is normal, UPSmart 2000I displays the status of UPS (e.g. input & output voltage, frequency, load, temperature and battery capacity ect.) in digital, graphic and Real-time data curve, which help the user monitor the quality of powersupply; When the Mains break off or UPS battery low, UPSmart 2000I will perform its monitoring function without people around. It will automatically save records, shut down systems in security. And in addition it add more possible means to automatically send the warning message, including email sending ect. which make the user no need to worry about any systems or file lost during the Mains off.

Features

- Support DB9 and USB connection
- Auto monitor when turn on UPS
- Auto test equipment connection
- Real-time display UPS status in digital, graph and data
- Be convenient for the user to set up partial function as users like
- Be convenient to perform UPS and system in schedule without people around
- Make UPS operating data in records
- Auto email events notification
- Set up auto on/off time
- Set up off countdown time and the interval of each warning
- Set up UPS self-testing time
- Auto close program and files saved before system auto off
- Auto save files when turn off UPS

EAStars

EAStars

EAStars is designed to facilitate UPS monitoring. Not only could monitor UPS stand-alone, EAStars also could make real-time network monitoring and management of UPS. Integrated monitoring can be achieved by coordinating corresponding PC software. And it is quite convenient for computer room administrative personals to take network management for UPS. EAStars provides very simple installation program. It only needs to install the EA_Search software attached by this product in PC, after search or set the IP address of EAStars by it, it can land the page of EAStars by browser with obtained IP to take further setup. EAStars can remotely monitor the working condition and environment condition of UPS by internet. Administrative personals can take remote monitoring of UPS by landing the internet to check real-time status of UPS and know the working voltage, current, frequency, temperature and humidity of UPS as well as know whether there is some fault for UPS. EAStars also can provide various operations for different operating systems. It can, according to detailed setting, set the power off and test of UPS at some certain time; set authority of login user, username, and IP, etc.

Features

- Can set all functions by browser;
- Can monitor real-time status of UPS by browser; Support protocols such as TCP/IP, FTP, HTTP, SMTP and SNMP, etc.;
- Provide IP search and updating tools (EA_Search);
- Can send the daily report by Email;
- Can send related information to administrative personals by Email if there is any fault for UPS;
- Can add GPRS message module by request of users (message module shall be purchased additionally).
